POWERS**A WATTS INDUSTRIES CO.****DESCRIPTION**

The rugged Powers Type VE single seat bronze body valve is primarily used for steam and water modulating applications where precision low flow is required.

Additionally, the modified equal percent characteristic provides fine throttling action at low valve plug travel. Stainless steel trim is standard.

APPLICATION

To properly size a valve either follow these criteria or use the PowerSize® Valve Sizing Program available at www.powerscontrols.com.

- **Body Material and Rating.** Refer to Body Temperature/ Pressure Ratings table to insure your application fits in the acceptable operating range. Also determine that the valve body material is compatible with your media.
- **Trim Material.** Stainless steel.
- **Flow Coefficient (CV Rating).** Refer to PowerSize Valve Sizing Program, Powers' Engineering Guide (form #PEG v1), or specifying engineer's data to determine Cv. Select a valve size that most closely matches the calculated Cv from the Flowing ΔP, Close Off ΔP, and Cv Ratings table.
- **Flowing Pressure Drop (ΔP).** To avoid cavitation and its accompanying trim damage, the following operating ΔP limits should be observed.

- **Liquid Service.** ΔP less than the quantity $(0.66 \times \text{inlet pressure}) + 10$. Additionally, flowing ΔP should not exceed 100 psi.
- **Steam Service.** ΔP less than the quantity $(0.5 \times \text{inlet pressure}) + 7.35$. Additionally, flowing ΔP should not exceed 100 psi.
- **Actuator Selection.** The actuator must have enough force to close off against line pressure or maximum ΔP. The 3–15 and 1–17 columns in the Close Off ΔP and Cv Ratings table apply to valves with control signals coming directly from I/P transducers. The 0–30 column applies to valves using Accritem® type pneumatic controllers or valves equipped with a positioner or 0–30 PSI I/P transducer.

I/ P TRANSDUCERS

The "standard" 3-15 psi signal was originally designed as a transmission signal, not a valve actuation signal. Unbalanced control valves have their operational limits lowered when forced to operate with this 3-15 psi signal. The Fluid Controls Institute (in Standard 87-2) has recommended that a 1-17 psi air signal range be used when directly actuating a control valve without a positioner. Powers concurs with this recommendation, and therefore, offers a 1-17 psi I/P transducer and a 0-30 psi I/P transducer for maximum close-off. 3-15 psi I/P transducers should be used in conjunction with positioners.

POSITIONERS

Positioners are used for one or more of the following reasons:

- 1) To split range valves.
- 2) To eliminate unwanted valve movement caused by line pressure variations
- 3) To minimize the effects of "stick-slip"
- 4) To speed response time and/or
- 5) To increase close-off rating when I/Ps are used.
